

# Video Game Recommendations

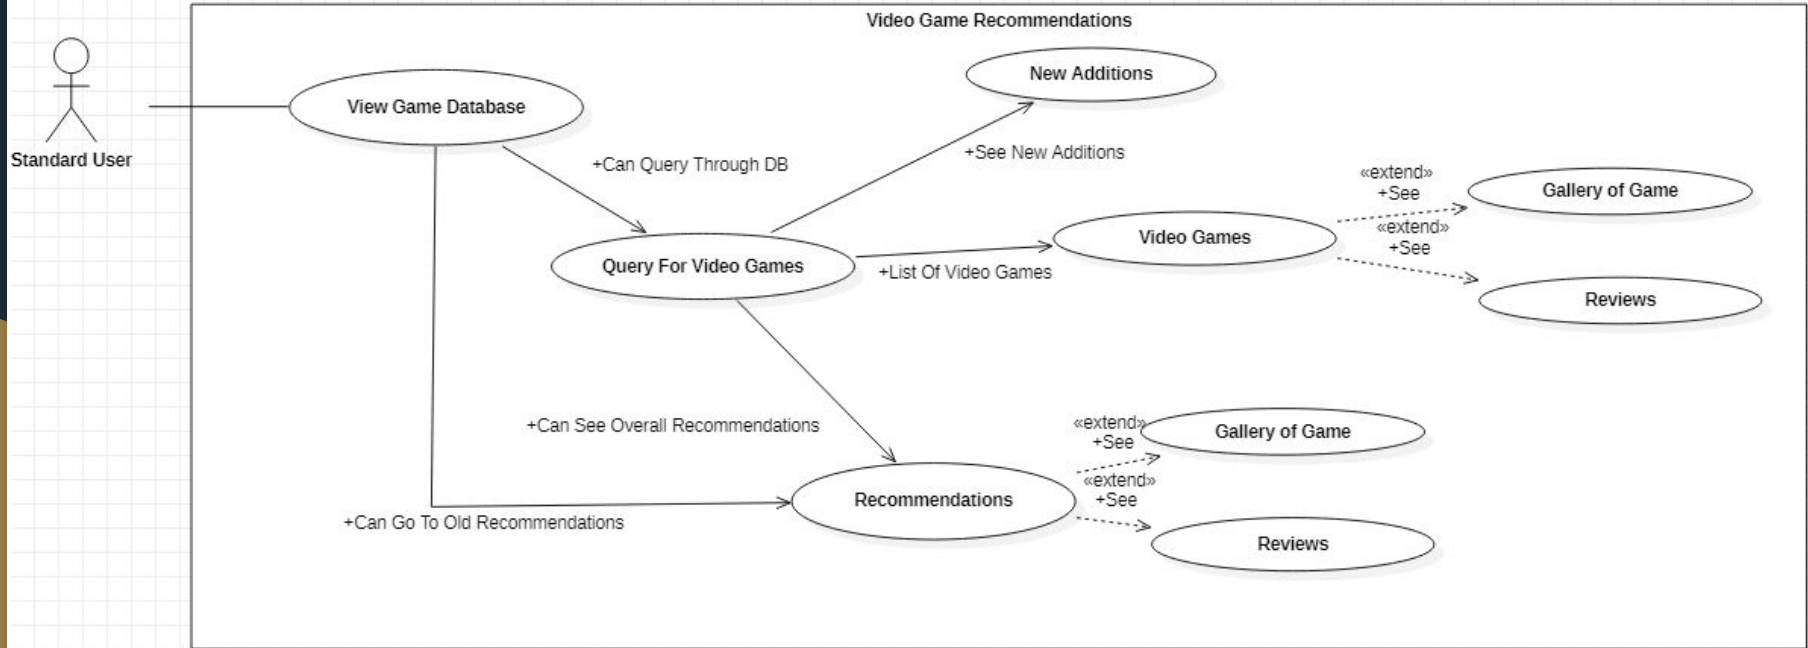

Bryce Keeton & Carlos J Landos

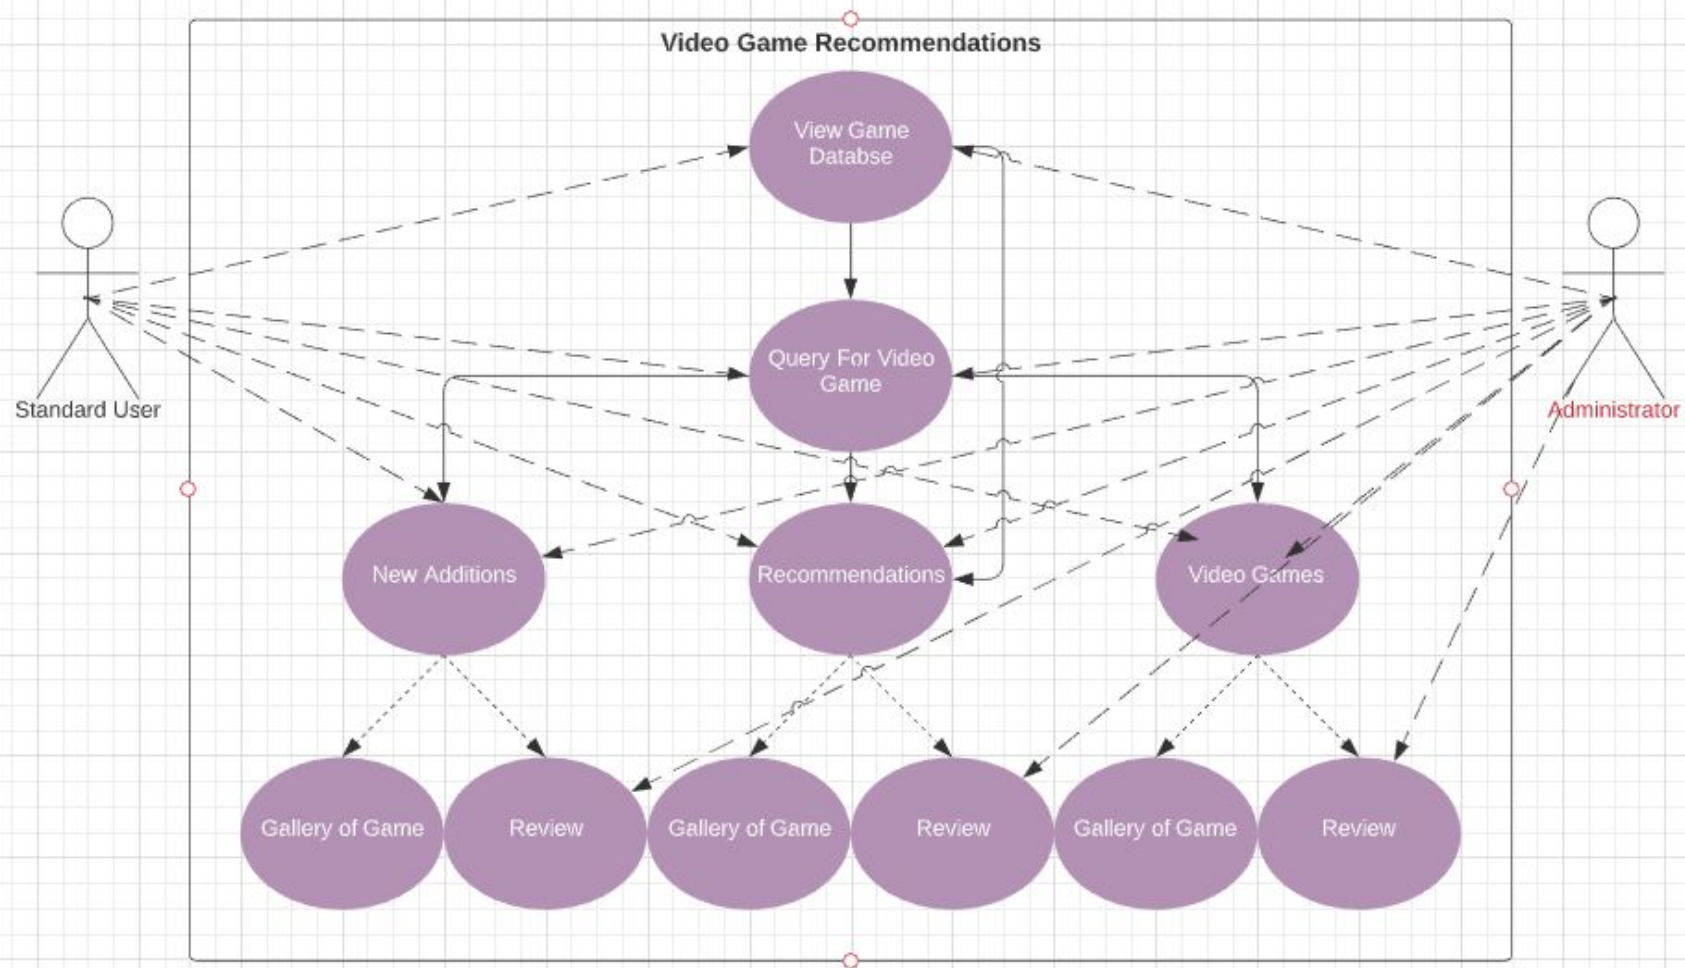

# System Description

- Our project is a video game recommendation program
- Users will be able to add to the database, review video games, or simply get video game recommendations
- Users will be able to add their favorite video games to the database and update the database
- Users will be able to review video games, giving a rating out of 10 and a text review
- Users will be able to query the database to receive video game recommendations, as well as see previously recommended video games

# Use Case Diagram

# Language and Implementation

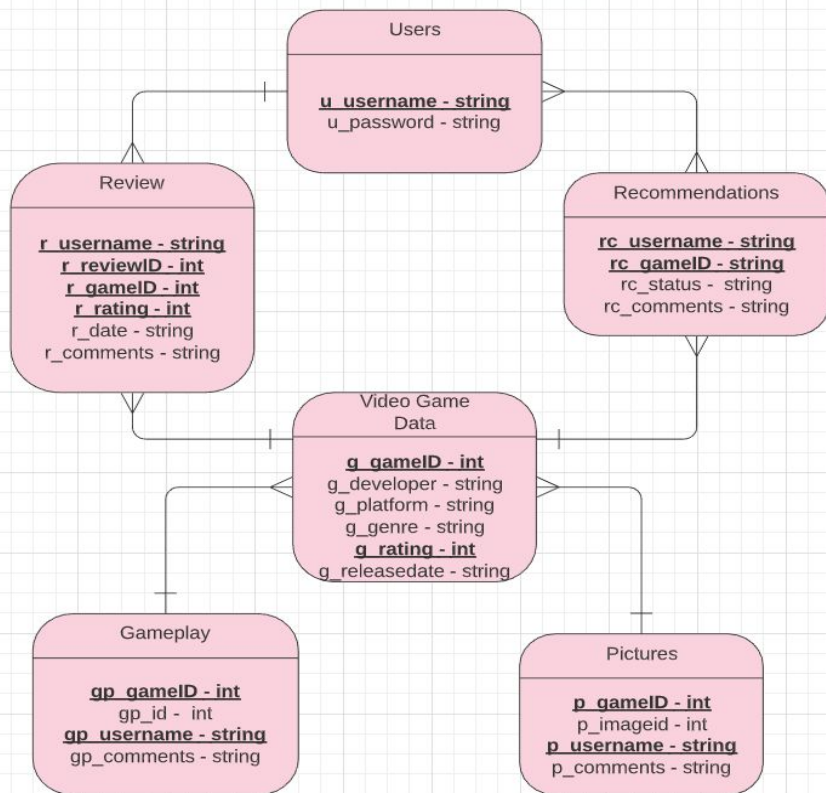

We are going to use SQLite to implement the databases and use Django to create the program.

Django allows us to create a server as well as implement any form of HTML or javascript that we may need to make the database look good
